Being a Science Teacher

By Ella

“When a child says science is boring I cringe. Science is the world, and that's far from boring.”
Teachers

- Teachers make their own lesson plans and always thinking of different ways to show kids new information. They grade papers, test and projects.

- They are role models, setting good examples of what is appropriate. Teachers also inspire students in all senses of their lives.
Teaching Relates to Science

- Science teachers need to teach kids methods and theories. How to problem-solve and how to find evidence that support decisions.

- The diverse sciences taught by teachers include chemistry, biology, physics, astronomy, Earth science, computer Science...etc.

Why science teachers should not be given playground duty.
The Schooling

- Science teachers need to get their bachelor’s or master’s degree in a science field and also your teaching credentials.

- Getting a degree in a specific science field would take 4 years and getting their teaching credentials would take another year.
- Teachers salary in general is $32k-72k per year.

- Teachers in the U.S. don’t get paid enough for the work they do. In other countries teachers can get double the amount that teachers get paid here.
Why did I pick this job?

- The reason why I picked this job is because I want to become a teacher. Probably not a science teacher but a teacher nevertheless.

- I wanted to learn more about being a teacher and all the different aspects of the job.

- Learning all this information is showing me that teachers are great and I can’t wait to be one myself.
